

WABA Panel 2026

NodeJS Edition — Premium Self-Hosted

Installation Guide

One command. About 15 minutes.

KKHS Media • kkhsmedia.com

Support: WhatsApp +91 70620 10000 • info@kkhsmedia.com

Version 2026.1 (v120) — August 2026

1. What you need before you start

Item	Requirement
Server (VPS)	Ubuntu 22.04 or 24.04, 2 vCPU / 4 GB RAM / 40 GB disk minimum. Root (or sudo) access.
Domain	A domain or subdomain, e.g. <code>panel.yourdomain.com</code>
DNS	An A record for that domain pointing to your server's IP address.
License key	Your <code>NJSP-...</code> key from your purchase email.

Important: point the domain to the server before installing. The free SSL certificate can only be issued once DNS is working.

2. Install — one command

1 Connect to your server (from Windows PowerShell, Mac Terminal, or your host's web console):

```
ssh root@YOUR_SERVER_IP
```

2 Run the installer — copy this single line, paste, press Enter:

```
bash <(curl -fsSL https://kkhsmedia.com/downloads/install.sh)
```

3 Answer 2 questions:

Question	What to type
Your panel domain	<code>panel.yourdomain.com</code>
Email for the free SSL certificate	your email address

4 Wait. That's it — nothing else to type. The installer automatically does everything:

- Installs Node.js 22, MongoDB 7, PM2, Nginx
- Creates swap memory on small servers so the build never fails
- Creates both `.env` files with fresh random secrets
- Installs dependencies, seeds the admin account, builds the frontend (once)
- Starts both services under PM2 and enables auto-start on reboot
- Configures Nginx and issues a free Let's Encrypt SSL certificate
- Runs a health check and prints the result

Finished screen. When you see **“DONE! WABA Panel 2026 is installed.”** with
Backend health : 200 Frontend: 200 , your panel is live.

3. First login

Open	<code>https://panel.yourdomain.com</code>
Email	<code>admin@wabapanel.com</code>
Password	<code>admin123456</code>

Do these two things immediately:

1. Change the admin password (Profile → Change Password).
2. Go to **Admin** → **License** and paste your `NJSP-...` key, then click Activate.

4. Fully unattended install (optional)

To install without any questions at all — useful for automation or for resellers setting up many panels:

```
bash <(curl -fsSL https://kkhsmedia.com/downloads/install.sh) \
  --domain panel.yourdomain.com --email you@yourmail.com --yes
```

Installing from the downloaded ZIP instead

If you prefer to upload the ZIP yourself, unzip it and run the same script from inside the folder:

```
unzip WABA-Panel-2026-NodeJS-by-KKHS-Media-v120.zip -d /opt/wabapanel
cd /opt/wabapanel && bash install.sh
```

The ZIP already contains the latest code and version marker, so the panel does **not** download and re-build dozens of old patches after install. This is why installation now takes about 15 minutes instead of over an hour.

5. Everyday commands

Command	What it does
<code>pm2 status</code>	Shows if the panel is running
<code>pm2 restart all</code>	Restarts the panel
<code>pm2 logs wabapanel-api</code>	Live backend logs (Ctrl+C to exit)
<code>pm2 logs wabapanel-app</code>	Live frontend logs
<code>systemctl status mongod</code>	Checks the database
<code>certbot renew</code>	Renews SSL (usually automatic)

6. Updates

Updates are automatic. Once your license is activated, the panel checks with the KKHS update server and applies new patches by itself, then rebuilds once. You never need to re-install or re-upload the ZIP.

7. If something goes wrong

Problem	Fix
SSL step failed	Your domain's DNS is not pointing to the server yet. Fix the A record, wait a few minutes, then run: <code>certbot --nginx -d panel.yourdomain.com</code>
Site shows 502 Bad Gateway	The app is still starting. Wait 1 minute, then <code>pm2 status</code> . If it shows errored, run <code>pm2 logs</code> and send us the last lines.
Build failed / server froze	Not enough RAM. Use a 4 GB server (the installer adds swap automatically, but 2 GB is very tight), then run the installer again.
Cannot log in	Run <code>cd /opt/wabapanel/wabapanel-express && npm run seed</code> to recreate the admin account.
License not activating	Make sure the panel is opened on the exact domain registered with your license, and that the server can reach kkhsmedia.com.
Want to re-run the installer	Safe to run again. Your existing <code>.env</code> is kept (a backup is saved as <code>.env.bak</code>).

8. Support

WhatsApp **+91 70620 10000** • Email **info@kkhsmedia.com** • **kkhsmedia.com**

Please include your domain, a screenshot of the error, and the last 20 lines of `pm2 logs`.
